4148 - Scottish Borders Parking - Peebles - Arrivals vs Departures
(Thu 18th August 2016 09:00 - 17:00)

This sheet provides a brief description of what information is held within each tab of this document, and how the results were achieved.

RESULTS TAB

Occupancy Vehicles by Link Table :- This table shows the occupancy per street / per beat. Therefore the maximum total value is the maximum number of vehicles present within the study area throughout the survey day. The graph below this table shows the "Accumulative" capacity - street by street stacked.

Duration of stay (Hrs) by Arrival Time :- This table presents the duration of stay (In Hours) that a vehicle has stayed for relative to the time period that it arrived (Example : 10 Vehicles arrived within beat 2 and stayed for 5 hours). The graph below this table shows the "Accumulative" number of vehicles by time period.

Arrivals vs Departures by Survey Period :- This table presents the number of vehicle that have arrived or departed within the survey. Note that a vehicle cannot depart in the 1st beat as the vehicle has to be active within the system to be departed. Generally the number of vehicles captured in the 1st beat represents the number of vehicles "In @ Start". The table to the right of table graphically shows the Arrival & Departure trend line.

PARKING TAB

Vehicle Information :- This tab contains all the VEHICLE information data which has been linked spatially to its nearest classified link restriction. This information can be easily queried by using the filter option to select specific streets, timebins, classification and much more. .

CAPACITY

Length of classifications (m) by link :- This table shows the length (Metres) of each classification within each street, that has been surveyed as part of the project. The length of each restriction is taken from a site visit using GIS and measuring the kerbside length. Only kerbside restrictions are captured, the more enforceable the restriction the higher it is in the survey hierarchy. For example a Double Yellow line is more enforceable than a dropped kerb. Where there is no kerbside restriction present this will be classified as "Unrestricted".

Calculated capacity (spaces) by link :- The table shows the number of spaces available within each individual network section (No of Spaces). This is calculated by two methods. The first method is to count the actual number of physical individual marked spaces within the section (example 5 number Parallel Bays). The second method is used where the spaces are not individually marked or there is no restriction present, to calculate the capacity using this method we would take each individual section length and divide it by 5 m (Standard car length) rounding the value "DOWN" at all calculations. As each restriction length is calculated individually, the combined value of capacity will often be less than the total length divided by 5m.

LINKS CLASSIFIED

Link Classification :- This tab contains all the individual link (Classified Restrictions) within the survey area providing details on the ID, Class, Length and Capacity. The column titled "Count of Vehicles" is the number of vehicles captured parking on the section throughout the survey period which is used to calculate the next column "Turnover" by dividing the number of vehicles captured by the number of spaces available.

STRESS LEVEL

This table shows the capacity stress level (Legally Parked Only) for each street within the survey area for each beat conducted. It is possible for % capacity to exceed 100% if vehicle are parking closer together and the number of vehicles recorded within a beat is greater than that of the Capacity Calculation detailed above (Example. a section length of 29.2 m / 5 m = 5 Vehicles. However, in practise it would be possible to accommodate 6 vehicles).
